2R20042	RM1 Add Report Operation Audjrn Support <ul style="list-style-type: none"> o Report Manager implements reports as *USRIDX objects, storing filters and subscriptions as index entries and the report definition as the object's associated space. The software was written in 1992 when the only means to manipulate these was with MI Independent Index and Space instructions. These do not generate audit journal entries and therefore make it difficult to mirror reports. Audit journal entry generating API replacements for all the functions used have not been provided in i5/OS. Changes have been made to the code that manages reports, filters and subscriptions to call the QUSADDUI API to "touch" a report after changes have been made to it. The API in turn generates audit journal entries if requested by the system's auditing settings. 	10/09/08	2R20054
2R20043	MSU PINGMAIL Command Enhanced <ul style="list-style-type: none"> o The PINGMAIL command has been enhanced to include a from address and to allow SMTP authentication username and password. o Previously, only one e-mail address was accepted by the command and it was used as both the originator and the recipient of the test message. This limited some of the cases of SMTP server behavior that could be test. o Some internet service providers require SMTP authentication before they will accept out going e-mail from an account. To date, IBM has not implemented this in i5/OS' SMTP stack. When a username and password are specified, PINGMAIL uses them to perform SMTP authentication (PLAIN only). In many cases, you can use this feature to perform SMTP authentication for your system. The SMTP stack will then be able to use the connection to send e-mail through the 	10/09/08	2R20054
